2018/2019

# On Algorithms

What are algorithms? A set of **instructions** to solve a **problem**.

- The problem is the **motivation** for the algorithm
- The instructions need to be **executable**
- Typically, there are **different algorithms** for the same problem  
[how to choose?]
- **Representation**: description of the instructions that is understandable for the intended audience

*My favourite dish* Pasta with bacon and tomato sauce

**Ingredients**

- 1 red onion
- 2 red peppers
- 120 g bacon
- 1 can (450 g) tomatoes
- olive oil
- garlic
- oregano
- 50 g pasta per person

**Method**

- 1 Cut the onion, red peppers and bacon into small pieces.
- 2 Heat some olive oil in a pan and fry the onion, red peppers and bacon.
- 3 Add oregano, garlic, tomatoes and water and cook for 20 minutes.
- 4 Cook the pasta in a big pot of boiling water.
- 5 Serve the pasta with the sauce, and enjoy!

# On Algorithms

"Computer" Science version

- An algorithm is a **method** for solving a (computational) problem
- Algorithms are the **ideas** behind the programs and are independent from the programming language, the machine, ...
- A **problem** is characterized by the description of its **input** and **output**

A classical example:

## Sorting Problem

**Input:** a sequence of  $\langle a_1, a_2, \dots, a_n \rangle$  of  $n$  numbers

**Output:** a permutation of the numbers  $\langle a'_1, a'_2, \dots, a'_n \rangle$  such that  $a'_1 \leq a'_2 \leq \dots \leq a'_n$

## Example instance for the sorting problem

**Input:** 6 3 7 9 2 4

**Output:** 2 3 4 6 7 9

# On Algorithms

What do we aim for?

- What **properties** do we want on an algorithm?

## Correction

It has to solve correctly **all instances** of the problem

## Efficiency

The performance (**time** and **memory**) has to be adequate

- This course is about **designing** correct and efficient algorithms and how to **prove** they meet the specifications

# About correction

- In this lecture we will (mostly) worry about **correction**
  - ▶ Given an algorithm, it is not often obvious or trivial to know if it is **correct**, and even less so to **prove** this.
  - ▶ By learning how to reason about correctness, we also gain **insight** into what really makes an algorithm work

# When is an algorithm correct?

## Ex. 2.1: What do these functions do?

```
int fa (int x, int y){  
    // pre: True  
    ...  
    // pos: (m == x || m == y) &&  
    //       (m >= x && m >= y)  
    return m;  
}
```

```
int fb (int x, int y){  
    // pre: x >= 0 && y >= 0  
    ...  
    // pos: x % r == 0 && y % r == 0  
    return r;  
}
```

```
int fc (int x, int y){  
    // pre: x > 0 && y > 0  
    ...  
    // pos: r % x == 0 && r % y == 0  
    return r;  
}
```

```
int fd (int a[], int N){  
    // pre: N>0  
    ...  
    // pos:  
    //   (forall_{0<=i<N} x<=a[i]) &&  
    //   (exists_{0<=i<N} x==a[i])  
    return x;  
}
```

# Specification

---

# When is an algorithm correct?

## Ex. 2.2: Formulate pre- and post-conditions:

```
int prod (int x, int y) – product of two integers
int gcd (int x, int y) – greatest common divisor of 2 positive integers
int sum (int v[], int N) – sum of elements in an array
int maxPOrd (int v[], int N) – length of the longest sorted prefix of an array
int isSorted (int v[], int N) – tests if an array is sorted (growing)
```

A triple  $\{P\}S\{Q\}$  is a valid Hoare triple when

if  $[P \text{ holds}]$  and  $[S \text{ is executed}]$  then  $[Q \text{ holds}]$

**Ex. 2.3: Find initial states that show these are not valid (and fix pre-cond.)**

1.  $\{\text{True}\} \ r=x+y; \ \{r \geq x\}$
2.  $\{\text{True}\} \ x=x+y; \ y=x-y; \ x=x-y; \ \{x==y\}$
3.  $\{\text{True}\} \ x=x+y; \ y=x-y; \ x=x-y; \ \{x \neq y\}$
4.  $\{\text{True}\} \ \text{if}(x>y) \ r=x-y; \ \text{else} \ r=y-x; \ \{r>0\}$
5.  $\{\text{True}\} \ \text{while} \ (x>0) \ \{y=y+1; \ x=x-1;\} \ \{y>x\}$

## Partial correctness

---

slides by Pedro Ribeiro, slides 1  
pages 6-11

# Loops

- We will tackle one of the most fundamental (and most used) algorithmic patterns: a **loop** (e.g. `for` or `while` instructions)

## Example loop: summing integers from 1 to $n$

```
sum = 0
i = 1
while (i ≤ n) {
    sum = sum + i
    i = i + 1
}
```

- We will talk about how to prove that a **loop** is correct
- We will show how this is also useful for **designing** new algorithms

# Loop Invariants

## Definition of Loop Invariant

A **condition** that is necessarily true immediately before (and immediately after) each iteration of a loop

Note that this says nothing about its truth or falsity part way through an iteration.

*Instructions are for computers, invariants are for humans*

- The loop program statements are "**operational**", they are "**how to do**" instructions
- Invariants are "**assertional**", capturing "**what it means**" descriptions

# Anatomy of a loop

Consider a simple loop: **while (B) { S }**

- **Q**: precondition (assumptions at the beginning)
- **B**: the stop condition (defining when the loop end)
- **S**: the body of the loop (a set of statements)
- **R**: postcondition (what we want to be true at the end)

**Example loop: summing integers from 1 to  $n$**

```
sum = 0
i = 1
while (i ≤ n) {
    sum = sum + i
    i = i + 1
}
```

- **Q**:  $sum = 0$  and  $i = 1$
- **B**:  $i \leq N$
- **S**:  $sum = sum + i$  followed by  $i = i + 1$
- **R**:  $sum = \sum_{i=1}^n i$

# The invariant?

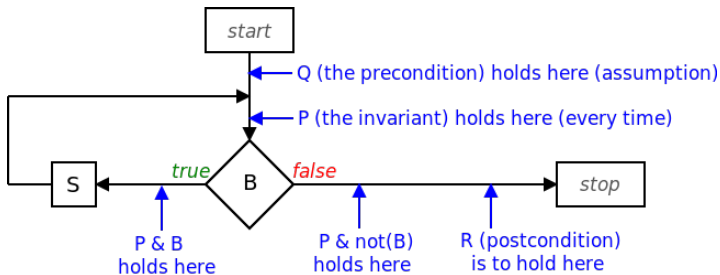

- **P**: an invariant (condition that holds at the start of each iteration)

- To be **useful**, the invariant  $P$  that we seek should be such that:  
 $P \wedge \text{not}(B) \rightarrow R$

► For the example sum loop, it could be:  $\text{sum} = \sum_{i=1}^{i-1} i$

# How to show that an invariant is really one?

- First, show that  $Q \rightarrow P$   
(truth precondition  $Q$  guarantees truth of invariant  $P$ )
  - ▶ For the example sum loop:  $\text{sum}=0$  which is  $= \sum_{i=1}^0 i$
- If  $P \wedge B$ , then after executing  $S$ , then  $P$  holds after executing  $S$   
(the statements  $S$  of the loop guarantee that  $P$  is respected)
  - ▶ For the example sum loop:  $\sum_{i=1}^{i-1} + i = \sum_{i=1}^i$

# How to show that an invariant is really one?

## Initialization

The invariant is true prior to the first iteration of the loop

## Maintenance

If it is true before an iteration of the loop, it remains true before the next iteration

## Termination

When the loop terminates, the invariant gives us a useful property that helps show that the algorithm is correct

## Using rules for Hoare triples

$$\frac{P \Rightarrow Q[x \backslash E]}{\{P\} x := E \{Q\}}$$

$$\frac{P \Rightarrow I \quad \{I \wedge c\} S \{I\} \quad (I \wedge \neg c) \Rightarrow Q}{\{P\} \text{ while } c S \{Q\}}$$

1.  $P \Rightarrow I$ : Before the cycle the invariant holds.
2.  $\{I \wedge c\} S \{I\}$ : Assuming the invariant holds before an iteration, it must be valid after the iteration.
3.  $(I \wedge \neg c) \Rightarrow Q$ : After the cycle the post-condition holds.

# Exercises

```
int mult1 (int x, int y){
    // pre: x>=0
    int a, b, r;
    a=x; b=y; r=0;
    while (a!=0){
        r = r+b;
        a = a-1;
    }
    // pos: r == x * y
    return r;
}
```

```
int mult2 (int x, int y){
    // pre: x>=0
    int a, b, r;
    a=x; b=y; r=0;
    while (a!=0) {
        if (a%2 == 1) r = r+b;
        a=a/2;
        b=b*2;
    }
    // pos: r == x * y
    return r;
}
```

**Ex. 2.4:** Check if *Initialization* and *Maintenance* holds for these formulae

$$r == a * b$$

$$a \geq 0$$

$$b \geq 0$$

$$r \geq 0$$

$$a == x$$

$$a \neq x$$

$$b == 0$$

$$a * b == x * y$$

$$a * b + r == x * y$$

# Exercises

```
int mult1 (int x, int y){  
    // pre: x>=0  
    int a, b, r;  
    a=x; b=y; r=0;  
    while (a!=0){  
        r = r+b;  
        a = a-1;  
    }  
    // pos: r == x * y  
    return r;  
}
```

```
int mult2 (int x, int y){  
    // pre: x>=0  
    int a, b, r;  
    a=x; b=y; r=0;  
    while (a!=0) {  
        if (a%2 == 1) r = r+b;  
        a=a/2;  
        b=b*2;  
    }  
    // pos: r == x * y  
    return r;  
}
```

**Ex. 2.5:** Find loop invariants to prove partial correctness

## Some intuition – mult1(4,5)

```
1 int mult1 (int x, int y){  
2   // pre: x>=0  
3   int a, b, r;  
4   a=x; b=y; r=0;  
5   while (a>0){  
6     r = r+b;  
7     a = a-1;  
8   }  
9   // pos: r == x * y  
10  return r;  
11 }
```

line	x	y	a	b	r
4	4	5	4	5	0
6	4	5	4	5	5
7	4	5	3	5	5
6	4	5	3	5	10
7	4	5	2	5	10
6	4	5	2	5	15
7	4	5	1	5	15
6	4	5	1	5	20
7	4	5	0	5	20
10	4	5	0	5	20

## Some intuition – mult1(4,5)

```
1 int mult1 (int x, int y){
2   // pre: x>=0
3   int a, b, r;
4   a=x; b=y; r=0;
5   while (a>0){
6     r = r+b;
7     a = a-1;
8   }
9   // pos: r == x * y
10  return r;
11 }
```

line	x	y	a	b	r
4	4	5	4	5	0
6	4	5	4	5	5
7	4	5	3	5	5
6	4	5	3	5	10
7	4	5	2	5	10
6	4	5	2	5	15
7	4	5	1	5	15
6	4	5	1	5	20
7	4	5	0	5	20
10	4	5	0	5	20

- x and y never change
- r grows proportionally as a shrinks
- guess:  
$$/ \triangleq a*y + r = x*y$$

## Some intuition – mult1(4,5)

```
1 int mult1 (int x, int y){
2   // pre: x>=0
3   int a, b, r;
4   a=x; b=y; r=0;
5   while (a>0){
6     r = r+b;
7     a = a-1;
8   }
9   // pos: r == x * y
10  return r;
11 }
```

line	x	y	a	b	r
4	4	5	4	5	0
6	4	5	4	5	5
7	4	5	3	5	5
6	4	5	3	5	10
7	4	5	2	5	10
6	4	5	2	5	15
7	4	5	1	5	15
6	4	5	1	5	20
7	4	5	0	5	20
10	4	5	0	5	20

- x and y never change
- r grows proportionally as a shrinks

- guess:

$$I \triangleq a*y + r = x*y$$

- Need to show:

$$x \geq 0 \Rightarrow I'$$

$$I \wedge a > 0 \Rightarrow I'$$

$$I \wedge \neg(a > 0) \Rightarrow r = x*y$$

## Some intuition – mult1(4,5)

```
1 int mult1 (int x, int y){
2   // pre: x>=0
3   int a, b, r;
4   a=x; b=y; r=0;
5   while (a>0){
6     r = r+b;
7     a = a-1;
8   }
9   // pos: r == x * y
10  return r;
11 }
```

line	x	y	a	b	r
4	4	5	4	5	0
6	4	5	4	5	5
7	4	5	3	5	5
6	4	5	3	5	10
7	4	5	2	5	10
6	4	5	2	5	15
7	4	5	1	5	15
6	4	5	1	5	20
7	4	5	0	5	20
10	4	5	0	5	20

- x and y never change
- r grows proportionally as a shrinks

▪ guess:

$$I \triangleq a*y + r = x*y$$

- Need to show:

$$x \geq 0 \Rightarrow I'$$

$$I \wedge a > 0 \Rightarrow I'$$

$$I \wedge \neg(a > 0) \Rightarrow r = x*y$$

- (Not all works – enrich invariant!)

## More exercises

```
int serie(int n){  
    // pre: n>=0  
    int r=0, i=1;  
    // inv: ??  
    while (i!=n+1) {  
        r = r+i; i = i+1;  
    }  
    // pos: r == n * (n+1) / 2;  
    return r;  
}
```

```
int mod(int x, int y) {  
    // pre: x>=0 && y>0  
    int r = x;  
    while (y <= r) {  
        r = r-y;  
    }  
    // pos: 0 <= r < y && exists_{q}  
        x == q*y + r  
    return r;  
}
```

### Ex. 2.5: Find loop invariants

# Even more exercises (@home)

```
int minInd (int v[], int N) {
    // pre: N>0
    int i = 1, r = 0;
    // inv: ???
    while (i<N) {
        if (v[i] < v[r]) r = i;
        i = i+1; }
    // pos: 0 <= r < N && forall_{0 <= k < N} v[r] <= v[k]
    return r; }

int minimum (int v[], int N) {
    // pre: N>0
    int i = 1, r = v[0];
    // inv: ???
    while (i!=N) {
        if (v[i] < r) r = v[i];
        i=i+1; }
    // pos: (forall_{0 <= k < N} r <= v[k]) &&
    //       (exists_{0 <= p < N} r == v[p])
    return r;
}

int sum (int v[], int N) {
    // pre: N>0
    int i = 0, r = 0;
    // inv: ???
    while (i!=N) {
        r = r + v[i]; i=i+1;
    }
    // pos: r == sum_{0 <= k < N} v[k]
    return r;
}
```

```
int sqr1 (int x) {
    // pre: x>=0
    int a = x, b = x, r = 0;
    // inv: ??
    while (a!=0) {
        if (a%2 != 0) r = r + b;
        a=a/2; b=b*2;
    }
    // pos: r == x^2
    return r;
}

int sqr2 (int x){
    // pre: x>=0
    int r = 0, i = 0, p = 1;
    // inv: ??
    while (i<x) {
        i = i+1; r = r+p; p = p+2;
    }
    // pos: r == x^2
    return r;
}

int ssearch (int x, int a[], int N){
    // pre: N>0 &&
    //       forall_{0 < k < N-1} a[k-1]<=a[k]
    int p = -1, i = 0;
    // inv: ??
    while (p == -1 && i < N && x >= a[i]) {
        if (a[i] == x) p = i;
        i = i+1;
    }
    // pos: (p == -1 && forall_{0 <= k < N} a[k] != x) ||
    //       (0 <= p < N ) && x == a[p])
    return p;
}
```

## Complete correctness

---

Given  $\{P\} S \{Q\}$

## Partial correctness

if  $[P \text{ holds}]$  and  $[S \text{ is executed}]$  then  $[Q \text{ holds}]$

## Complete correctness

if  $[P \text{ holds}]$  and  $[S \text{ is executed}]$  then  $[Q \text{ holds}]$  AND  $S$  terminates

Given  $\{P\} S \{Q\}$

## Partial correctness

## Complete correctness

if  $[P \text{ holds}]$  and  $[S \text{ is executed}]$  then  $[Q \text{ holds}]$  AND  $S$  terminates

Enough to show the existence of a **loop variant**

# Loop variant

Technique that measures the distance between the current state and the final state.

**A loop variant  $V$  is an integer expression s.t.**

- is positive in the beginning of each round ( $c \wedge I \Rightarrow V > 0$ )
- decreases in every round ( $I \Rightarrow V > V'$ )

```
r=x;  
q=0;  
while (y <= r) {  
    r = r-y;  
    q = q+1;  
}
```

- $V = r - y$  is not a good variant
- ...

# Loop variant

Technique that measures the distance between the current state and the final state.

**A loop variant  $V$  is an integer expression s.t.**
